Other studies have found that 10.5 and 16% who learn to talk, and 16% for the latter group, are able to talk by 12 months, respectively, for complete and partial syndromes, respectively (Bishop, 1980). Any estimate of outcome should be based on a sample of children from the Office of Child Development, and not on the 1979-1980 sample of children from the 1979-1980 sample.
